50 State HPI

Highlights

- House prices nationally are now 54.4 percent higher compared to pre-pandemic levels (February 2020).
- House price growth reported in last month's HPI for July 2024 to August 2024 was revised down 0.2 percentage points, from 0.1 percent to -0.1 percent.

Chief Economist Analysis:

"Annual house price appreciation nationally slowed for the ninth consecutive month, falling to the slowest pace since the summer of 2023," said Mark Fleming, chief economist at First American. "While home prices reached a new record high in September, the pace of growth continues to slow. Lower mortgage rates have improved affordability, which will likely stimulate demand in the coming months, especially if rates continue to ease. If housing supply does not increase amid that potential increased demand, it's possible that price appreciation could accelerate again."

Price-Tier Highlights

The First American Data & Analytics HPI segments home price changes at the metropolitan level into three price tiers based on local market sales data: starter tier, which represents home sales prices at the bottom third of the market price distribution; mid-tier, which represents home sales prices in the middle third of the market price distribution; and the luxury tier, which represents home sales prices in the top third of the market price distribution.

"Price appreciation in 11 metros outpaced the national 3.9 percent annual increase, and house prices increased year over year in most markets we track as well," said Fleming. "The ongoing price pressures in the starter home price tier across many markets highlights strong demand from first-time home buyers now armed with improved house-buying power, who face limited inventory at this price point."

HPI Methodology

The First American Data & Analytics HPI report measures single-family home prices, including distressed sales, with indices updated monthly beginning in 1980 through the month of the current report. HPI data is provided at the national, state and CBSA levels and includes preliminary index estimates for the month prior to the report (i.e. the preliminary result of July transactions is reported in August). The most recent index results are subject to revision as data from more transactions become available.

The HPI uses a repeat-sales methodology, which measures price changes for the same property over time using more than 46 million paired transactions to generate the indices. In non-disclosure states, the HPI utilizes a combination of public sales records, MLS sold and active listings, and appraisal data to estimate house prices. This comprehensive approach is particularly effective in areas where there is limited availability of accurate sale prices, such as non-disclosure states. Property type, price and location data are used to create more refined market segment indices. Real Estate-Owned transactions are not included.
