## 50 State HPI

#### Highlights

- House prices nationally are now 52 percent higher compared to pre-pandemic levels (February 2020).
- House price growth reported in last month's HPI for January 2024 to February 2024 was revised up 0.3 percentage points, from 0.7 percent to 1.0 percent.

"Persistent inflation has diminished any optimism that the Federal Reserve may start to cut rates in June, meaning mortgage rates seem more and more likely to remain 'higher for longer' this year," said Mark Fleming, chief economist at First American. "Many sellers will remain on strike keeping a lid on supply. However, as we saw last fall when mortgage rates peaked, demand may also wane. Even though the supply of homes for sale will remain tight, sagging demand should further slow price appreciation in a 'higher-for-longer' mortgage rate environment."

## Price-Tier Highlights

The First American Data & Analytics HPI segments home price changes at the metropolitan level into three price tiers based on local market sales data: starter tier, which represents home sales prices at the bottom third of the market price distribution; mid-tier, which represents home sales prices in the middle third of the market price distribution; and the luxury tier, which represents home sales prices in the top third of the market price distribution.

"Starter home price appreciation will continue to face upward pressure in a 'higher-for-longer' market. Starter homes are the least supplied because it is the market segment most supplied by existing homeowners, who are the most vulnerable to the rate lock-in effect and thus unable or unwilling to list their home for sale to fuel a move-up purchase," said Fleming. "Starter-tier prices are increasing year over year by more than 10 percent in Nassau County, N.Y., Pittsburgh, Miami and New York."

#### TABLE 3 Price-Tier Highlights

CBSA	Starter YOY	Mid-Tier YOY	Luxury YOY
New York-Jersey City-White Plains, NY-NJ*	10.2%	9.6%	2.9%

## HPI Methodology

The First American Data & Analytics HPI report measures single-family home prices, including distressed sales, with indices updated monthly beginning in 1980 through the month of the current report. HPI data is provided at the national, state and CBSA levels and includes preliminary index estimates for the month prior to the report (i.e. the preliminary result of July transactions is reported in August). The most recent index results are subject to revision as data from more transactions become available.

The HPI uses a repeat-sales methodology, which measures prices changes for the same property over time using more than 46 million paired transactions to generate the indices. In non-disclosure states, the HPI utilizes a combination of public sales records, MLS sold and active listings, and appraisal data to estimate house prices. This comprehensive approach is particularly effective in areas where there is limited availability of accurate sale prices, such as non-disclosure states. Property type, price and location data are used to create more refined market segment indices. Real Estate-Owned transactions are not included.
